

Product Brief – Gas Delivery App

Platform: Android

Project Stage: MVP / Market Validation

Prepared by: Delia

1. Product Overview

Gas Delivery App is an **on-demand gas delivery platform** that connects customers with **licensed freelance gas delivery drivers** within a 10 km radius. The app enables customers to order, pay, and track gas deliveries in real-time, while offering drivers flexible earning opportunities.

This MVP is about **validating demand and operations**, while setting up for the final and fully automated product.

2. Primary Objectives

Core Features:

1. User Registration & Profiles

- Separate registration for customers and drivers.
- Verification for drivers (upload license & vehicle documents). Drivers will get access to the application form via the website, once their application is approved, only then will they get a link to download the drivers app.
- Customers can download the app from Google/ Apple store.
- Profile management: name, contact info, delivery address, preferred payment method.

2. Geo-Location & Radius Matching

- Detect customer's location automatically.

- Match customer requests with available drivers within a 10 km radius.
- Show estimated delivery time and distance-based pricing.

3. Ordering System

- Simple product selection (e.g., 9kg, 19kg, 48kg gas cylinders).
- Check-out page calculates products ordered + service fees
- Pop- up to confirm order before proceeding to payment.

4. Real-Time Tracking & Notifications

- Live driver tracking once delivery is accepted.
- Push notifications for order updates (Order Received, On the Way, Delivered).
- In-app messaging or call button between driver and customer.

5. Payments (Future options - Wallet)

- Payment options - card via Paystack
- Driver earnings per order in driver dashboard.

6. Driver Dashboard

- View new delivery requests in real-time.
- Accept/reject orders based on availability.
- Daily/weekly earnings summary and transaction history.

7. Admin Panel (MVP version)

- Monitor all active deliveries and driver activities.
- Add/remove drivers or approve new ones.

- Basic reporting: sales, total deliveries, revenue.

The app must:

1. Be live on **Google Play Store** for testing
 2. Allow real customers to place gas orders
 3. Allow the business to receive and manage those orders
 4. Be simple, stable, and cost-effective
 5. Support iteration after launch
-

3. User Roles

A. Customer (Primary User)

- Wants fast, easy gas ordering
- Values reliability and confirmation
- Does not need advanced features at this stage

B. Admin / Operations (Internal User)

- Needs visibility of orders
 - Needs basic control over order status
 - Manual fulfillment is acceptable
-

5. Explicit MVP Non-Requirements (Out of Scope)

The following were **not required** at this stage:

- Automated payments for drivers
- Driver apps or tracking
- Advanced analytics
- Route optimization
- Multi-language support

These may be considered **after validation**, not before.

6. Functional Flow (End-to-End)

Customer Flow

1. User opens app
 2. User registers or logs in
 3. User selects gas size
 4. User enters delivery details
 5. User submits order
 6. User sees confirmation
 7. User can view order status and delivery status
-

Admin Flow

1. Admin logs into dashboard

2. New order appears
 3. Admin reviews order details
 4. Admin can update order status
 5. Customer sees updated status
-

7. Success Criteria

The MVP is considered successful when:

- The app is live on Google Play Store
 - Users can place real orders
 - Orders can be fulfilled operationally
 - The business can test demand and pricing
 - Infrastructure costs are sustainable
-

10. Future Considerations (Not MVP)

Potential future features include:

- Payments
- Smart gas tracking / sensors that enables **reordering** through our gas delivery app
- Subscriptions
- Full driver app
- Automation and optimization
- AI intergration

These are **explicitly excluded** from MVP scope.

11. Development Expectations

- Clear communication of blockers
- No scope or infrastructure changes without discussion
- MVP mindset over over-engineering
- Advanced communication for all cost increases
